PRODUCT DEVELOPMENT PROCESS

PROCESS

Product Development Process starts with our base product. This is our own `built from scratch` product that provides plug-n-play support for our all other plugins & 3rd party plugins.

In this step we majorly work on customizing the UI/UX as per the client's need. This includes the enhancement and development of Progressive Web Application that will act as Responsive Web Page in Desktops and internal native app in Android and iOS Platform.

After Development, next phase is the deployment of the product that includes all the process required for preparing an application to run and operate in a specific environment. It involves installation, configuration, testing and making changes to optimize the performance of the product.

We, at ASHPlan Media, provide GO LIVE SUPPORT which means our team of professionals are there for your assistance for initial 24 hours of your Go Live Day i.e. when your site will be up and running.

02

Product Development starts with gathering client's requirements and providing an input on industry specific requirements of client that needs to be implemented on our base product.

This leads to the generation of a basic layout of how the final product will function and how it will help client achieve its goal. We put our effort at this step to define the limitation of scope of development which is very crucial to ensure the efficiency of solution.

03

As soon as we gather all the required information on the functionality and execution of how the final product should perform, our team of professionals will begin with the development process of Client's Industry specific product.
